

10A4500 / 10A4600 VA Master™ Indicating Flowrator®

The measurement solution for visual flow indication

Measurement made easy

Rugged, high-strength stainless steel body

- Suited with corrosion-resistant type 300 stainless steel support frame
- Slim design for space limited installation locations

Flexibility with ease

- Easily removable tube and float for re-ranging or maintenance purposes without removing from line
- Available with snap-in O-ring option or packing gland assembly
- Versatile, universal threaded or flanged rotating and field adjustable end fittings for any connection orientation

Safety and operator protection

- Safe operation with thick-walled polycarbonate shield designed to protect personnel from glass fragments in the event of accidental tube rupture
- Rear- and downward-facing slots to divert flows in the event of rupture

Maximized visibility

- Wide-angle view local visual indication with polished protector shield

Versatile indicating and alarm options

- Suited with up to three scales for varying process conditions
- Optional alarm system for minimum and/or maximum limits.

High corrosion-resistant model

- Optional configuration with wetted components suited for aggressive liquids

10A4500 / 10A4600 VA Master™ Indicating Flowrator®

VA Master™ Indicating Flowrator®

The ABB VA Master Flowrator meter is a glass tube variable area flowmeter that provides visual indication of flow rate over a 12^{-1/2} to 1 range on a linear scale. It can be fitted with an O-ring or packing gland seal design for application suitability.

With either seal design, the glass meter tube is easily removable for re-ranging or cleaning and without the need to disassemble fittings or remove from the meter from the line. Both types have the same installation dimensions and are interchangeable with regard to piping assembly. An optional alarm system with one or two bi-stable sensors can be integrated for open/close signals for rising or falling flowrates.

Universal threaded process connections allow for horizontal or vertical in-line installation and can be fitted with screw-on flanges as a standard option

Principle of operation

The function of a variable area flowmeter, commonly known as a Rotameter, depends on the dynamic equilibrium of a free floating body being acted on by various physical forces within a closed system. The free body is referred to as a float and the closed system as a tube with controlled geometric characteristics, namely its variable cross-sectional area. The float is free to move vertically up and down the symmetrical tube and is acted on by the various forces. The main three are gravity, buoyancy and inertial forces. The float weight represents the magnitude of gravity. The float will remain at the bottom of the tube until buoyancy and inertial forces of a fluid flow act in the opposite, upward direction against gravity.

The float is designed to have a diameter large enough to restrict passage of fluid and a higher density than the measured fluid. As a liquid or gas begins to flow through the tube, the buoyancy lightens the float but is not sufficient to allow it to truly 'float'. The inertial force of flow passage of a fluid around the float creates resistance and the fluid pressure drop starts increasing. When the upward buoyancy and inertial forces exceed the force of gravity, the float begins to move up the tube until the open cross sectional area is large enough to reduce the differential pressure until the float reaches an equilibrium position a distance up the tube which is then related to a specific flowrate marked on a scale.

Aside from the governing equations and consideration of all acting forces, the variable area flowmeter is also influenced by several fouling factors like fitting or valve discharge coefficients or other obstructions. These are accounted for with the use of prediction flow curves fine-tuned with the use of decades of calibration and test data. The scales used to relate a float position up the tube to a flowrate are dependent on this empirical data and the equilibrium governing equations which take into account the flowing process conditions such as density, temperature and static pressure.

Operational components

Fig. 1: Basic components of a variable area meter. Support fittings, tube and float

Specification – model 10A4500

Measurement

Fluid

Gases, clean liquids

Flow range

12¹/₂ to 1

Repeatability

0.5 % full scale

Accuracy

2 % full scale

1 % optional with calibration

Connections

Sizes

1/2, 3/4, 1, 1 1/2

Types

Threaded F-NPT, flanged

Orientations

Vertical:

Top, bottom

Horizontal:

Left, right, back

Scales

Sizes

Standard 10 in. (9 in. for 1/2 to 50 only)

Types

Direct, percent (on metal scale), tube, both

Materials of construction

Tube

Borosilicate glass

Tube rest gaskets

Klinger-Sil

Tube retainer spring

Armco 17-7 pH stainless steel

Fittings

316 stainless steel, others available

Meter body

304L stainless steel

Seals (by type)

Packing gland:

Neoprene, PTFE

O-rings:

Buna-N, Viton®, EPR

Float

316 stainless steel

Non-standard (extended lead time):

Hastelloy-C, Monel, Tantalum, PVC (lead loaded), PTFE

Float stops

PTFE

Alarms

Types

High, low, high/low, high/high, low/low, DPDT, SPDT

Electrical specifications

Power requirements

120V AC (standard)

220V AC / 24V DC available on request

Contact rating

Max. 250 V; Max. 2A

Sensor switch cable length

Standard – 6.5 ft.

Optional – up to 980 ft.

Sensor safety classification

Intrinsically safe – Class I, Div. 1, Group A-D & Class II, Div. 1 Group E-G with amplifier in non-hazardous location

General

Mounting

Line, front panel, rear panel (not available with flanges)

Float and tube combinations

See capacity tables below

Valves

Optional external needle valve (316 stainless steel and nipple un-assembled)

Services

Oxygen cleaning, standard calibration, high viscosity calibration (up to 100 cst), hydro testing

Specification – service conditions (all models)

Pressure rating – stainless steel fittings

Connection size (in.)	Tube size (in.)	Maximum design pressure PSIG (kPa) @ 100 °F (38 °C)	
		NPT	Flange
1/2		300 (2070)	275 (1890)
3/4	3/4 and 1	200 (1380)	–
1	3/4 and 1	200 (1380)	200 (1380)
1 1/2		130 (890)	130 (890)
1 1/2	2	100 (690)	100 (690)

Pressure rating – PVC fittings

Connection size (in.)	Tube size (in.)	Maximum design pressure			
		NPT		Flange	
		100 °F (38 °C)	140 °F (60 °C)	100 °F (38 °C)	140 °F (60 °C)
1/2		260 (1790)	92 (634)	150 (1035)	50 (345)
3/4	3/4 and 1	200 (1380)	75 (517)	–	–
1	3/4 and 1	–	–	150 (1035)	50 (345)
1 1/2		130 (897)	53 (365)	130 (897)	50 (345)
1 1/2	2	100 (690)	53 (365)	100 (690)	50 (345)

- Ensure that installation location process conditions will not exceed the allowable operating conditions.
- Applications: Glass tube meters are not recommended for continuous service on alkalis above 100 °F (38 °C) or more than 20 % concentrations; nor for fluorine, hydrofluoric acid, water above 200 °F (93 °C), steam, slurries, or molten metal.
- Is it important that the O-ring material be compatible with the process fluid. Meter tube breakage can occur if the wrong material is used. For example: VITON O-RING MUST NEVER BE USED FOR AMMONIA SERVICE.

Temperature rating

Minimum recommended process fluid temperature is 32 °F (0 °C). Maximum recommended process fluid temperature is 250 °F (121 °C).

Ambient temperature range

32 to 140 °F

Weights

Connection size (in.)	Tube size (in.)	Stainless steel fittings		PVC fittings	
		Threaded	Flanged	Threaded	Flanged
		Weight in lbs. (kg)

10A4500 / 10A4600

VA Master™ Indicating Flowrator®

Accessories

Metal scale plate(s)	Graduated metal scale plate mounted adjacent to metering tube.
Alarms	One or two* bi-stable alarm switches, adjustable over entire scale length to give contact closure (or opening) upon rising or falling flow. Available with SPDT or DPDT switch action. *Note when using two switches, the minimum spacing is on 1 in. centers (approx. 10 % of full scale).
Surface (front) panel mounting	Nuts, bolts, and lock washers for mounting meter against front of panel by means of mounting holes provided in every meter body.
Flush (rear) panel mounting	Brackets, bezel and hardware for mounting meter behind panel.
Welded Flanges	Upon request, flanges / nipples / end fittings can be supplied as a welded assembly.

WARNING – Glass tube Rotameters must not be operated without the operator protection shield in place. Doing so could result in serious injury to personnel.

Corrosion resistant material options

The V/A Master is available with various corrosion resistant material options and takes advantage of the inherent chemical resistivity of borosilicate glass tubes. PVC fittings are available as a standard option with PTFE or Neoprene packing glands. Additionally, several float designs are available out of PTFE, PVC and Tantalum for liquid applications.

Ordering information

To eliminate any delays in the processing of orders and to ensure prompt delivery, please specify:

- Complete model number
- Accuracy desired
- Alarm settings if applicable
- Operating conditions
- Fluid measured
- Maximum flow rate and unit of flow
- Fluid density
- Fluid viscosity
- Allowable pressure drop
- Operating and maximum temperature
- Operating and maximum pressure

Meter sizing

Simplified sizing is possible with the use of capacity tables. These are a set of tabulated values for each tube and float combinations. The values displayed are of water or air with densities at standard temperature and pressure (STP). The values on these tables can be used directly if the process fluid is air or liquid under STP process conditions.

If process conditions are other than STP, the following equations can be used to find a 'water or air equivalent' value. QA or QW values can be found by specifying operating conditions. These values can then be used to select the most adequate tube and float combination. Special attention must be taken when converting process conditions to specified variable units. Equations 1-4 are used for stainless steel floats, and equations 5-6 for floats of other materials.

Capacity tables liquid conversion equations (stainless steel floats only)

Volumetric water equivalent (equation 1)

$$Q_W = Q_L \times \sqrt{\frac{7.02 \times P_f}{8.02 - P_f}}$$

Gravimetric (mass) water equivalent (equation 2)

$$Q_W = \frac{W_L}{8.33 \times P_f} \times \sqrt{\frac{7.02 \times P_f}{8.02 - P_f}}$$

Where:

- Q_W = water equivalent in gpm
- Q_L = process fluid flowrate in gpm
- W_L = process fluid mass flowrate in lb/min
- P_f = process fluid density in S.G. with respect to water density at 70 °F

Capacity tables gas conversion equations (stainless steel floats only)

Volumetric air equivalent (equation 3)

$$Q_A = Q_G \times \sqrt{\frac{14.7 \times P_g \times T_o}{530 \times P_o}}$$

Gravimetric (mass) air equivalent (equation 4)

$$Q_A = 13.34 \times W_g \times \sqrt{\frac{14.7 \times T_o}{530 \times P_g \times P_o}}$$

Where:

- Q_A = air equivalent in SCFM
- Q_G = process fluid flowrate in SCFM
- W_g = process fluid mass flowrate in lb/min
- P_g = process fluid density in S.G. with respect to air density at 70 °F and 14.7 psia
- T_o = operating temperature in °R
- P_o = operating pressure in psia

Capacity tables liquid conversion equations (non-stainless steel floats) – refer to capacity tables 4 and 5

Volumetric water equivalent (equation 5)

$$Q_W = Q_L \times \sqrt{\frac{(P_c - 1) \times P_f}{P_c - P_f}}$$

Gravimetric (mass) water equivalent (equation 6)

$$Q_W = \frac{W_L}{8.33 \times P_f} \times \sqrt{\frac{(P_c - 1) \times P_f}{P_c - P_f}}$$

Where:

- Q_W = water equivalent in gpm
- Q_L = process fluid flowrate in gpm
- W_L = process fluid mass flowrate in lb/min
- P_c = float density in g/cm³ *
- P_f = process fluid density in S.G. with respect to water density at 70 °F

* Float densities in g/cm³

Tantalum: 16.6

Table 1: Low pressure drop design

Notes

1. Pressure drop is total pressure loss across the meter at 100 % flow rate in inches of water column.
2. Meter is unaffected by viscosity when the value of cps/\sqrt{p} (using p = operating density in g/cc and cps = viscosity in centipoise) is less than VIC (viscosity immunity ceiling). VIC is applicable to liquids only – all gas flows fall below VIC.
3. Meters are not recommended for gas service where pressure is below minimum shown. A flow throttling valve close-coupled to meter outlet is not recommended for all gas applications.
4. Standard percent scales are not applicable to low pressure drop floats.
5. Values for Q_w and Q_A (water and air flow equivalents) can be determined using equations 1-4. See 'Meter sizing' on page 7.

Table 2: Bead guide meters with USV, SV and NSV floats (continued)

Notes

1. Pressure drop is total pressure loss across the meter at 100 % flow rate in inches of water column.
2. Meter is unaffected by viscosity when the value of cps/\sqrt{p} (using p = operating density in g/cc and cps = viscosity in centipoise) is less than VIC (viscosity immunity ceiling). VIC is applicable to liquids only – all gas flows fall below VIC.
3. Meters are not recommended for gas service where pressure is below minimum shown. A flow throttling valve close-coupled to meter outlet is not recommended for all gas applications.
4. Unless other shown, range is equal to, or greater than, 12.5:1.
5. Short range floats; BL-954 is 8:1; BL-953 is 3.5:1; BL-950 & BL-951 are 3:1.
6. Values for Q_w and Q_A (water and air flow equivalents) can be determined using equations 1-4. See 'Meter sizing' on page 7.

Additional ordering information

	Additional order codes						
Variant digit number	24, 25	26, 27	28, 29	30, 31	32, 33	34, 35	36, 37
Calibrations							
Standard; uncalibrated accuracy	C1						
Calibrated accuracy; liquids at 1 ctk. viscosity	C2						
Calibrated accuracy; liquids at viscosity up to 100 ctk. (¹ / ₂ , ³ / ₄ and 1 in.)	C3						
Calibrated accuracy; liquids at viscosity up to 100 ctk. (1 ¹ / ₂ and 2 in.)	C4						
Calibrated accuracy; gas service (stainless steel fittings only)	C6						
External needle valve (stainless steel fittings only)							
¹ / ₂ in. NPT, part number 614C068U03 (see Note 9)		V3					
³ / ₄ in. NPT, part number 614C068U04 (see Note 9)		V4					
Preparation procedure							
Oxygen cleaning per ABB 3BUJ980096			P1				
Certifications							
Certificate of conformance; per order				D1			
Material certifications							
'Typicals' per material					M1		
Pressure test							
Hydrostatic pressure test; ¹ / ₈ to ¹ / ₂ in. diameter							H1
Hydrostatic pressure test; ³ / ₄ to 1 in. diameter							H2
Hydrostatic pressure test; 1 ¹ / ₂ to 2 in. diameter							H3
Tags							
Stainless steel (wired on – per meter)							T1

Notes.

9. Valve sizes must be compatible with process connection size. Contact your local sales representative for other options.
