### Features

- Low pressure control
- Full range capability
- Compatible with corrosive and non-corrosive gases & liquids
- Ultra-sensitive pressure regulator

### Applications

- Chromatography
- Process stream sampling
- Bubbling operations
- Medical instrumentation
- Research laboratories
- Instrument calibration

### Technical Data

<b>Body Construction Material</b>	Polyvinyl chloride
<b>Spring Housing Materials</b>	• PVRB2 & PVRB3: Polyvinyl chloride • PVRB4 & PVRB5: Aluminum alloy
<b>Seat Material</b>	Kel-F®
<b>Diaphragm Material</b>	PTFE
<b>Adjustment Screw Material</b>	Delrin®
<b>Port Sizes</b>	¼" NPT female
<b>Pressure Ratings</b>	Maximum control pressure: 60 psig (4 BAR)
<b>Temperature Range</b>	0° F to +125° F (-18° C to +52° C)
<b>Flow Capacity</b>	Cv = 0.011 maximum Orifice diameter = 0.025"
<b>Weight</b>	PVRB2 & PVRB3: 14 oz PVRB4 & PVRB5: 1.5 lbs
<b>Leakage</b>	Bubble-tight
<b>Sensitivity</b>	Less than ½ psi

*Note: Proper filtration is recommended to prevent damage to sealing surfaces.*

### How it Works

#### Closed

With the unit spring load adjusted to the desired regulated "set" pressure, a dead-tight seal is affected against the applied upstream pressure.

#### Regulating

When the upstream process pressure (applied on the diaphragm) increases, an opposing force is generated which, through the diaphragm plate, acts against the "set" spring load.

As the increasing upstream pressure level reaches the "set" pressure, the poppet is gradually lifted off its seat. A consequent decrease in upstream pressure is experienced when the flowing fluid is relieved to the downstream side of the process at a faster rate than the upstream pressure can supply.

With decreasing upstream pressure, the spring force starts the poppet moving toward its closed position, thus maintaining the desired "set" pressure level within a narrow band.

When the upstream pressure has decreased to a level just below "crack", the adjusting spring load again creates a tight seal between the poppet and the sharp edge of the valve seat.

### Panel Mounting for PVRB4 & PVRB5

## How to Order

Note: if this regulator is to be used in oxygen service, specify "GENERAL OXYGEN SERVICE" when ordering or furnish the factory a copy of the special requirements.

Please consult your Circle Seal Controls distributor, representative, or the factory for information on special connections, operating pressures and temperature ranges.

## For Your Safety

It is solely the responsibility of the system designer and user to select products suitable for their specific application requirements and to ensure proper installation, operation, and maintenance of these products. Material compatibility, product ratings and application details should be considered in the selection. Improper selection or use of products described herein can cause personal injury or property damage.

 Monel® is a registered trademark of Special Metals Corporation.

## BP-3 Series\*

### Adjustable Back Pressure Regulators

The BP-3 Series is designed for either liquid or gas service in instrumentation systems. Similar in design to pressure reducing control regulators which regulate outlet pressures, back pressure regulators control the inlet pressure. The many features of this regulator, particularly its precise throttling action, make it ideal for this type of application. In low flow or closed systems, overpressures often are released by pressure relief valves. This type of relief is on-off with no throttling control. In contrast to relief valves, the back pressure control regulator with its throttling action substantially improves system pressure regulation.

\* Replaces the BPR7A and BPR8A Series.

#### Applications

- Analytical instrumentation
- Pilot plants
- Specialty gas systems
- Compressors
- Pump bypass
- Process vessel protection

#### Features & Specifications

- Only 316L stainless steel and PTFE in flow stream
- 316L stainless steel construction
- Operating temperatures of  $-40^{\circ}\text{F}$  to  $+500^{\circ}\text{F}$  ( $-40^{\circ}\text{C}$  to  $+260^{\circ}\text{C}$ )
- Bubble-tight shutoff
- Gas or liquid service
- Adjustable pressure control ranges of 0–6 psig, 0–10 psig, 0–25 psig, 0–50 psig, 0–100 psig, 0–250 psig, 0–500 psig, 0–750 psig, and 0–1,000 psig
- Cv flow coefficient is 0.2

#### Options

- Wetted materials of construction: brass, Monel®, Hastelloy®, titanium
- Extra ports
- Panel mount (requires a  $1\frac{1}{8}$ " mounting hole)
- High purity connections (tube stubs, metal face seals, etc.)
- Pressure gauges
- Optional Cv's: 0.03, 0.05, 0.06, 0.12, 0.24, 0.3, 0.095, 0.025, 0.04, 0.005, and 0.01

#### Maximum Temperature & Control Pressures

Seat Material	Maximum Temperature	@	Maximum Control Range
Viton®	250° F (121° C)	@	250 psig (1.72 MPa)
Kalrez®	300° F (148° C)	@	250 psig (1.72 MPa)
High-density PTFE	200° F (93° C)	@	500 psig (3.44 MPa)
Polyimide	500° F (260° C)	@	1,000 psig (6.89 MPa)
PEEK™	500° F (260° C)	@	1,000 psig (6.89 MPa)

Note: Temperatures in excess of 175° F (80° C) require the use of a metal knob or the tamper-proof option.

# BP-60 Series\*

## High Pressure Back Pressure Regulator

The BP-60 Series is the counterpart of the PR-50 pressure reducing series for systems that are higher in pressure and low to moderate flows. This regulator has a diaphragm for maximum sensitivity in providing relief at high pressures. The PTFE stainless seat assembly provides good shutoff in most applications. For economy purposes, the cap assembly and knob are of aluminum construction as in the PR-50 companion unit. Good sensitivity and a wide selection of control ranges make this regulator an excellent selection in many research and pilot plant facilities.

\* Replaces the BPR9A Series.

### Applications

- Pilot plants
- Analytical instrumentation
- Compressors
- Pump bypass
- Pressure vessel protection
- Hydrostatic testing

### Features & Specifications

- Adjustable pressure control ranges of 0–500 psig, 0–1,000 psig and 0–2,000 psig
- 316L stainless steel or brass (alloy 360) body construction
- Designed for moderate flow applications with standard Cv flow coefficient of 0.04
- Diaphragm sensing with nylon, PTFE, or stainless steel diaphragm
- Operating temperatures of –40° F to +350° F (–40° C to +176° C)
- Bubble-tight shutoff
- Inlet/outlet connections 1/4" FNPT

### Options

- Option Cv's available: 0.025, 0.005, 0.01
- Panel mounting
- 3/8" FNPT, AND10050–4, SAE J514 or MS33649 connections
- Monel® and Hastelloy® C body construction

### Maximum Temperature & Control Pressures

# BPR30 Series

*Corrosion Resistant Back Pressure Regulator  
160 to 2,500 psig*

## Features

- Positive shutoff at zero flow
- Compatible with corrosive or non-corrosive media
- Full range capability
- Unique design prevents clogging
- Tee handle for fast & precise control

## Applications

- Compressors
- Pump bypass
- Hydrostatic testing
- Water descaling systems
- Pressure vessel protection
- Reverse osmosis systems

## Technical Data

<b>Body Construction Materials</b>	Brass or 316 stainless steel
<b>Seal Materials</b>	Ethylene propylene, Neoprene, PTFE or Viton®
<b>Seat Material</b>	Kel-F®
<b>Trim Material</b>	Stainless steel exposed to line fluids
<b>Port Sizes</b>	¼" or ½" NPT female
<b>Weight</b>	2.75 lbs
<b>Pressure Ratings</b>	160 to 2,500 psig (11 to 172 BAR)
<b>Temperature Range</b>	-65° F to +250° F (-54° C to +121° C)
<b>Flow Capacity</b>	Cv = 0.25

*Note: Proper filtration is recommended to prevent damage to sealing surfaces.*

## How it Works

### Closed

With the unit spring load adjusted to the desired regulated "set" pressure, a dead-tight seal is effected against the applied upstream pressure by the small seating spring contained within the poppet and spring retainer.

### Regulating

When the upstream process pressure (acting on the regulating piston) increases, an opposing force is generated which, through the regulating piston, acts against the "set" spring load.

As the increasing upstream pressure level reaches the "set" pressure, the poppet is gradually lifted off its seat. A consequent decrease in upstream pressure is experienced when the flowing fluid is relieved to the downstream side of the poppet at a faster rate than the upstream pressure can supply.

With decreasing upstream pressure, the spring force starts the poppet moving toward its closed position, thus maintaining the desired "set" pressure level within a narrow band.

When the upstream pressure has decreased to a level just below "crack", the spring-loaded poppet again creates a tight seal against the sharp edge of the valve seat.

## BP-66 Series\*

High Pressure Back Pressure Regulator (10,000 psig)

The BP-66 Series is the counterpart of the PR-57 pressure reducing series for systems that are higher in pressure and low to moderate flows. This regulator has piston sensing to provide relief at high pressures. The Polyimide/stainless steel assembly provides good shutoff in most applications. For economy purposes, the cap assembly and knob are of aluminum construction as in the PR-57 companion unit. Good sensitivity and a selection of control ranges make this regulator an excellent selection in many research and pilot plant facilities.

\* Replaces the BPR1xA Series.

### Features & Specifications

- 316L stainless steel construction
- Adjustable pressure control ranges of 0–2,000 psig, 0–4,000 psig, 0–6,000 psig, 0–7,500 psig, and 0–10,000 psig
- Spring-loaded piston sensor
- Gas and liquid service
- Cv flow coefficient: 0.04
- Operating temperature of –40° F to +350° F (–40° C to +176° C)
- ¼" FNPT connections standard

### Applications

- Pilot plants
- Analytical instrumentation
- Compressors
- Pump bypass
- Pressure vessel protection
- Hydrostatic testing

### Options

- Monel® and titanium body construction
- Optional Cv's: 0.01 and 0.12
- Panel mounting

<b>Pressure Ratings</b>	Brass: 25 to 3,500 psig (1.7 to 241 BAR) Stainless steel: 25 to 6,000 psig (1.7 to 414 BAR)
<b>Temperature Range</b>	-65° F to +400° F (-54° C to +204° C)
<b>Flow Capacity</b>	Cv = 0.90 Orifice diameter = 0.23"

*Note: Proper filtration is recommended to prevent damage to sealing surfaces.*

## How it Works

### Closed

With a pressure regulator connected to the dome port and the dome pressure adjusted slightly above the desired regulated "set" pressure, a bubble-tight seal is effected against the applied upstream pressure.

### Regulating

When the upstream process pressure (applied to the inlet side of the diaphragm) increases, an opposing force is generated which acts on the diaphragm and attached poppet against the "set" pressure load in the dome.

As the increasing upstream pressure level reaches the "set" pressure, the poppet is gradually lifted off its seat. A consequent decrease in upstream pressure is experienced when the flowing fluid is relieved to the downstream side of the poppet at a faster rate than the upstream pressure can supply.

With decreasing upstream pressure, the pressure-loaded dome starts moving the poppet toward its closed position, thus maintaining the desired "set" pressure level within a narrow band.

When the upstream pressure has decreased to a level just below "crack" the generated forces from the pressure-loaded dome again create a tight seal between the poppet and the sharp edge of the valve seat.
