The PR-1 Series is a versatile specialty pressure reducing control regulator designed to fulfill a wide range of needs in instrumentation sample systems and other applications such as semiconductor processing gases. The many features of the PR-1 make it ideal for a wide range of applications controlling pressures at low to moderate flows in gas or liquid service. 316L material is used to facilitate welded connections. Stainless steel caps and adjusting screws prevent atmospheric corrosion and maintain appearance. Enhanced internal body surface finish of better than 25 Ra plus electropolishing allows easier cleaning and potentially less particle contamination in the flow stream.

Six different seat materials, three alternate orifice sizes and eight pressure control ranges with stainless diaphragms offer the user a wide spectrum of capabilities for pressure control with inlet pressures up to 6,000 psig and standard operating temperatures up to 500° F (260° C).

* Replaces the LPR and MR Series.

### Features & Specifications
- Gas or liquid service
- 316L stainless steel, Inconel®, Teflon®, and Tefzel® only in flow stream
- Electropolished 316L body with better than 25 Ra diaphragm cavity surface finish
- Stainless steel cap with stainless steel adjusting screw
- Inlet pressures of up to 6,000 psi
- Adjustable outlet pressure ranges of 0–6 psig, 0–10 psig, 0–25 psig, 0–50 psig, 0–100 psig, 0–250 psig, 0–500 psig, and 0–750 psig
- Operating temperatures of −40° F to +500° F (−40° C to +260° C)
- 20μ filters
- Bubble-tight shutoff under most conditions
- Cv flow coefficient: 0.06

### Options
- Wetted materials of construction: Monel®, Hastelloy® and titanium
- Diaphragm attached poppet
- Special fittings
- Diaphragm assist spring for vacuum purging
- Larger Cv’s of 0.2 and 0.5, smaller Cv’s of 0.025
- Panel mount (1¾” mounting hole)

For Your Safety

It is solely the responsibility of the system designer and user to select products suitable for their specific application requirements and to ensure proper installation, operation, and maintenance of these products. Material compatibility, product ratings and application details should be considered in the selection. Improper selection or use of products described herein can cause personal injury or property damage.
The PR-2 Series are compact brass body regulators designed for maximum flexibility in many classes of instrumentation service. Specifically designed for gas applications, this regulator is capable of accepting high pressures directly from cylinders and other high pressure, non-corrosive systems. It is ideally suited for carrier gas pressure regulation, yet it is economical enough to use in low-pressure air systems such as instrument cabinet air purge service.

* Replaces the LPR Series.

Features & Specifications
- Gas or liquid service
- Brass (alloy 360) construction
- Stainless steel diaphragm with Teflon® lining
- Stainless steel poppet
- Better than 25 Ra finish in diaphragm cavity
- 20μ inlet filter
- Bubble-tight shutoff
- Outlet pressure ranges: 0–10 psig, 0–25 psig, 0–50 psig, 0–100 psig, 0–250 psig, 0–500 psig and 0–750 psig
- Operating temperatures: −40° F to +175° F (−40° C to +80° C)
- Inlet and outlet connection: ¼˝ FNPT

Options
- ⅛˝ or ⅜˝ FNPT connections
- Panel mount (requires 1½˝ mounting hole)
- Extra ports
- Pressure gauges

PVR Series
Low Pressure Regulator
Inlet 0 to 3,000 psig & Outlet 2” H₂O to 60 psig

Features
• Low pressure control
• Exceptional accuracy & response
• Compatible with corrosive and non-corrosive gases & liquids

Applications
• Chromatography
• Process stream sampling
• Bubbling operations
• Medical instrumentation
• Research laboratories
• Instrument calibration

How it Works

Closed
With the poppet against the seat, full upstream pressure is applied to the poppet effecting a bubble-tight seal.

Regulating
When the downstream process demands flow, the pressure acting on the bottom of the diaphragm decays, allowing the adjusting spring force to push the poppet down. This in turn unseats the poppet, allowing flow to begin and pressure under the diaphragm to increase until balance is achieved between adjusting spring force and downstream pressure. This condition continues until process ceases. At this point, increasing pressure overcomes spring force, moving diaphragm up and allowing the poppet to close.

PR01 Series
Miniature Non-venting Regulator
Inlet 200 to 3,000 psig & Outlet 10 to 720 psig

How it Works

Closed
With the poppet against seat, full upstream pressure is applied to the poppet, effecting a bubble-tight seal.

Regulating
As the downstream process demands flow, the pressure acting on the piston decays, allowing the adjusting spring force to push the piston down, which in turn unseats the poppet. This permits flow to start, and pressure under the piston to increase, until balance is achieved between adjusting spring force and downstream pressure. This condition continues until process demand ceases, at which point increasing pressure overcomes spring force, moving piston up and allowing the poppet to close.

Features
- Miniature size: 1¾” diameter by 3½” high
- Soft seat—suitable for dead-end service
- Tight shutoff
- Single hole panel mounting
- Optional pressure gauges

Applications
- R & D pilot plants
- Research laboratories
- Chromatography
- Cylinder pressurization
- Bubbling operations
- Instrument pressurization
- Slow gas purge control
- Inert gas blanketing (food processing)
- Pilot control for large control units
- Lecture bottles

SR800 Series
High Capacity Pressure Regulator
Inlet to 3,600 psig & Outlet to 250 psig

Features
• High flow rates of 1.65 Cv
• Diaphragm provides maximum sensitivity
• Pressure relief valve for safety protection
• Panel mounting standard
• Wide range of fluid compatibility

Applications
• Manifold pressure control
• Process gas control
• Blanket or purge gas control
• High flow station or main line controls

How it Works
Closed
Balanced poppet is spring-loaded against the seat. When full upstream pressure is applied, a slightly unbalanced force is developed which enhances sealing.

Regulating
As the downstream process demands flow, the pressure acting on the bottom of the diaphragm decays, allowing the adjusting spring force to push the poppet down. This in turn unseats the poppet, allowing flow to begin and pressure under the diaphragm to increase until balance is achieved between adjusting spring force and downstream pressure. This condition continues until process demand ceases. At this point, increasing pressure overcomes the spring force, moving the diaphragm up and allowing the poppet to close.

IR10 Series
Brass Pressure Regulator
Inlet to 4,000 psig & Outlet to 2,500 psig

Features
• Medium pressure and high flow
• Balanced poppet provides precise control
• Soft seat for dead-end service
• Pressure relief valve for extra safety

Applications
• Chromatography
• Manifold & cylinder regulation
• Bubbling operations
• Hydrogenation
• Research laboratories
• Pressure testing

OUTLET PRESSURE RANGE

- **0** 0 to 500 psig (0 to 34 BAR)
- **1** 0 to 1,000 psig (0 to 70 BAR)
- **2** 0 to 2,500 psig (0 to 172 BAR)

Outlet pressure rise per 100 psi pressure decay: 0.1 psi max. Maximum inlet pressure: 4,000 psi

If this regulator is to be used in oxygen service, specify “GENERAL OXYGEN SERVICE” when ordering or furnish the factory with a copy of the special requirements.

Fluid media: non-corrosive gases and liquids.

Please consult your Circle Seal Controls distributor, representative, or the factory for information on special connections, operating pressures and temperature ranges.

PR50 Series
High Pressure Self-venting Pressure Regulator
Inlet & Outlet to 10,000 psig

Features
- Balanced poppet design
- Self-relieving captured vent
- Low operating torque

Applications
- High pressure testing
- Purging & charging
- Research laboratories
- Chemical/petroleum plants
- Manufacturing processes

Technical Data

| Body Construction Materials | Brass, 303 or 316 stainless steel |
| Seat Materials               | Kel-F® or Vespel®                  |
| Seal Materials               | Buna N, ethylene propylene, neoprene or Viton® |
| Port Sizes                   | ¼” and ½” NPT female, ½” male tube, or ½” British parallel pipe |
| Pressure Ratings             | Inlet: • CRES: to 10,000 psig (690 BAR) • Brass: to 6,000 psig (414 BAR) Outlet: 40 to 10,000 psig (2.7 to 690 BAR) |
| Temperature Range            | Viton®: −20° F to +225° F (−29° C to +107° C) All others: −40° F to +225° F (−40° C to +107° C) |
| Flow Capacity                | Cv = 0.30 Orifice diameter = 0.13” |
| Weight                       | 8.5 lbs (less gauges) |
| Leakage                      | Bubble-tight (air) |

Note: Proper filtration is recommended to prevent damage to sealing surfaces.

How it Works

Closed
Balanced poppet is spring-loaded against the seat. When full upstream pressure is applied, a slightly unbalanced force is developed which enhances sealing.

Regulating
As the downstream process demands flow, the pressure acting on the piston decays, allowing the adjusting spring force to push the piston down. This unseats the poppet, allowing flow to begin and pressure under the piston to increase until balance is achieved between adjusting spring force and downstream pressure. This condition continues until process demand ceases. At this point, increasing pressure overcomes the spring force, moving the piston up, allowing the poppet to close.

Venting
If the downstream pressure should increase beyond regulation set point or handle is backed off to decrease regulated pressure level, downstream pressure will vent through the piston and guide to the vent port. The pressure load from the piston overcomes the “set” spring load and moves the piston upward. The poppet is thereby unseated to allow venting flow. As pressure decreases under the piston, the reverse action occurs and the vent seat is closed off.

PR50 Series

How to Order

**REPAIR KIT**

**MAXIMUM OUTLET PRESSURE**

- **2** 40 to 400 psig (28 BAR)
- **3** 80 to 800 psig (55 BAR)
- **4** 150 to 1,500 psig (103 BAR)
- **5** 300 to 3,000 psig (207 BAR)
- **6** 450 to 4,500 psig (310 BAR)
- **7** 600 to 6,000 psig (414 BAR)
- **8** 1,000 to 10,000 psig (690 BAR)

**BODY MATERIAL**

- **B** Brass
- **U** 316 stainless steel
- **T** 303 stainless steel

**INLET & OUTLET PORTS**

- **1** ¼˝ NPT female
- **2** ½˝ NPT female
- **3** ½˝ tube (MS55649–8)
- **4** ½˝ British parallel pipe thread (vent port ¼˝ BPPT, gauge port ¼˝ BS taper thread)

**OPTIONS**

- **G** Gauges
- **N** 316 CRES panel nut

**CLEANING LEVELS**

- **1** General oxygen service**
- **2** General pneumatic service
- **3** Specify
- **4** Precision pneumatic service

**SEAT MATERIAL**

- **1** Vespel®
- **2** Kel-F® (limited to 3,000 psi inlet pressure, PR52–PR55 Series only)

**SEAL MATERIAL**

- **0** Ethylene propylene
- **1** Neoprene (standard)
- **3** Viton® (standard for oxygen service)
- **4** Buna N

* For best regulating characteristics, use only within 10% to 90% of maximum outlet pressure range. Either liquid or gas is handled equally well by the PR50 Series. No modification is required to convert from gas service to liquid. Seals and seats are available for nearly all liquids or gases. The PR50 is not recommended for continuous liquid service.

** For oxygen service, use Vespel® SP-21 seat and Viton® or neoprene seals.

Please consult your Circle Seal Controls distributor, representative, or the factory for information on special connections, operating pressures and temperature ranges.

For Your Safety

Material compatibility, product ratings and application details should be considered in the selection. Improper selection or use of products described herein can cause personal injury or property damage.
HPR50 Series
High Pressure, High Flow, Fluid Pressure Regulator
Inlet 0 to 10,000 psig & Outlet 40 to 10,000 psig

How it Works

Closed
The balanced poppet is spring-loaded against the seat.

Regulating
As the downstream process demands flow, the pressure acting on the piston decays, allowing the adjusting spring force to push the piston down, at which point increasing pressure overcomes spring force, moving the piston up and allowing the poppet to close.

Venting
If the downstream pressure should increase beyond regulation set point or the handle is backed off to decrease the regulated pressure level, the downstream pressure will vent through the piston and the guide to the vent port.

Features
- Balanced poppet design
- Metal-to-metal seating
- Captured self-venting
- 303 or 316 stainless steel, or brass body
- High pressure 0–10,000 psig inlet and outlet range
- High flow equal to Cv of 0.30
- Internal damper for surge flows
- Ryton™ 7 plastic handle

Applications
- Hydraulic test systems—high pressure
- Off-shore platforms—valve actuation
- Deep water drilling—hydraulic support
- Manufacturing processes

GD720 Series
High Pressure, Manually Controlled Pressure Reducing Regulator
Inlet 0 to 10,000 psig & Outlet 5 to 6,000 psig

How it Works

Closed
Balanced poppet is spring-loaded against the seat. When full upstream pressure is applied, a slightly unbalanced force is developed which enhances sealing.

Regulating
As the downstream process demands flow, the downstream pressure acting on the bottom of the diaphragm decays, allowing the adjusting spring force to push the poppet down. This in turn unseats the poppet, allowing flow to begin and pressure under the diaphragm to increase until balance is achieved between dome pressure and downstream pressure. This condition continues until process demand ceases. At this point, increasing pressure overcomes dome pressure force, moving diaphragm up, allowing poppet to close.

Venting
If the downstream pressure should increase beyond regulation set point, or handle is backed off to decrease regulated pressure level, downstream and dome pressure will vent through check valve and through the built-in LR Series regulator.

Features
- Full range capability
- Single hand wheel control
- Balanced poppet insures accuracy
- Integral vent valve

Applications
- Air compressor systems
- Oxygen system charging
- Aircraft tire struts
- Aircraft component pressure testing

Improper selection or use of products described herein can cause personal injury or property damage.
To meet the demands for the safe reduction of inlet pressures up to 10,000 psig, Circle Seal Controls provides the PR-57 Series regulator. This precision regulator features a piston-sensing design which provides the operator with low adjusting torque requirements when setting the outlet pressure. The body is constructed from 316L stainless steel, providing the ultimate in safety and corrosion resistance. The optional self-relieving feature provides an additional level in operational ease, as it allows for trapped downstream pressure to be safely vented to atmosphere through the bonnet.

* Replaces the LRxxE Series.

**Features & Specifications**
- Gas or liquid service
- 316L stainless steel construction
- Better than 25 Ra finish in diaphragm cavity
- Stainless steel spring-loaded piston sensor
- 20μ filter
- Bubble-tight shutoff
- Inlet pressure maximum 10,000 psig
- Outlet pressure ranges are 0–250 psig, 0–500 psig, 0–750 psig, 0–1,000 psig, 0–2,000 psig, 0–4,000 psig, 0–6,000 psig, 0–7,500 psig, and 0–10,000 psig
- Operating temperatures: −40° F to +150° F (−40° C to +66° C)
- Cv flow coefficient 0.05 or 0.2 (optional)

**Applications**
- Pilot plants
- Specialty gas
- Compressors
- High pressure test systems
- Breathing air tank refill

**Options**
- Gauges and CGA fittings for cylinder gas applications
- Self-relieving and captured vent
- ½” FNPT, 1/4” AND10050–4, 1/4” SAE J514, 1/4” MS33649, 1/4” Aminco, or 1/4” sch 40 pipe

GD30 Series
Inlet & Outlet 0–3,600 psig Dome-loaded Pressure Regulators

Features
- Bubble-tight seal
- Precise control
- Rapid delivery
- Easily adjusted

Applications
- Breathing systems
- Research laboratories
- Aircraft servicing
- Gas manifold systems
- Industrial gas plants
- Process gas control

How it Works

Closed
The unbalanced poppet is spring-loaded against the valve seat. Dead-tight sealing is ensured by a considerable force when full upstream pressure is applied over the entire effective area of the seating diameter.

Regulating
Dome-loading may be accomplished by the built-in load and bleed valve combination (or by an externally located pressure regulator) depending upon the specific model used for the application.

As the downstream process demands flow, the decreasing pressure (acting on the outlet side of the diaphragm) allows the dome pressure force to push the diaphragm and lower plate down which, in turn, unseats the poppet.

The described action permits flow to start and the pressure under the piston to gradually increase until balance is achieved between dome pressure forces and opposing downstream pressure forces.

The modulation of the poppet position continues in this manner until process flow demand ceases. The diaphragm is then moved in an upward direction, thus allowing the spring-loaded poppet to close off flow from the upstream side of the regulator.

How it Works

Closed
The balanced poppet is spring-loaded against the valve seat. When full upstream pressure is applied, a slight unbalanced force is developed which further enhances sealing.

Regulating
As the downstream process demands flow, the decreasing pressure (acting on the outlet side of the piston) allows the dome pressure force to push the piston down. This in turn unseats the poppet, which permits flow to start and pressure under the piston to gradually increase until a balance is achieved between the dome pressure forces. The modulation of the poppet position continues in this manner until the process flow demand ceases.

Venting
When the handle is turned to decrease the regulated pressure level, the dome pressure will vent through the dome vent and the downstream pressure will vent through the piston to the vent port.

BODY PART NUMBER INLET & OUTLET PORTS

1 ¼” NPT female
2 ½” NPT female
3 AND10050–8

SEAT MATERIAL

0 Ethylene propylene
1 Neoprene (standard)
3 Viton®
4 Buna N

OPTIONS

G Gauges (0–7,500 psig)

CLEANING LEVELS

1 General oxygen* (CSC/CCD 29.20)
2 General pneumatic (GEN CL’G)
3 Specify (define on sales order)

SEAT MATERIALS

1 Nylatron® GS (standard)
2 Kel-F® (limited to 3,600 psig max. inlet, 3,400 psig max. outlet)
9 Polyimide (Vespel® SP-21)

* For oxygen service: 3,600 psig max. inlet pressure and temperature range of −20°F to +250°F.

For Your Safety

It is solely the responsibility of the system designer and user to select products suitable for their specific application requirements and to ensure proper installation, operation, and maintenance of these products. Material compatibility, product ratings and application details should be considered in the selection. Improper selection or use of products described herein can cause personal injury or property damage.
GD62C & GD65C Series
Internally Dome-loaded Regulator
Inlet & Outlet to 7,000 psig

Features
- Bubble-tight seal
- High pressure
- Constant rapid delivery

Applications
- Breathing systems
- Research laboratories
- Aircraft servicing
- Facility gas systems
- Industrial gas products
- Process gas control

How it Works

Closed
The unbalanced poppet is spring-loaded against the valve seat. Dead-tight sealing is ensured by a considerable force when full upstream pressure is applied over the entire effective area of the seating diameter.

Regulating
Dome-loading may be accomplished by the built-in load and bleed valve combination. The rate of pressurization of the dome may be adjusted by the small screw-type needle valve located on the side of the unit.

As the downstream process demands flow, the decreasing pressure (acting on the outlet side of the diaphragm) allows the dome pressure force to push the diaphragm and lower plate down which, in turn, unseats the poppet.

The described action permits flow to start and the pressure under the piston to gradually increase until balance is achieved between dome pressure forces and opposing downstream pressure forces.

The modulation of the poppet position continues in this matter until process flow demand ceases. The diaphragm is then moved in an upward direction, thus allowing the spring-loaded poppet to close off flow from the upstream side of the regulator.

Technical Data

- **Body Construction Material**: Bronze
- **Seal & Diaphragm Materials**: Neoprene or Viton®
- **Seat Material**: Nylatron® or Vespel® SP-21
- **Gauge Material**: Brass, 2½” diameter
- **Port Sizes**: ¼”, ½” pipe, AND10050–4 or –8 or CGA fittings
- **Temperature Range**: –65° F to +160° F (–54° C to +71° C)
- **Flow Capacity**: Cv = 0.17
- **Orifice diameter = 0.095”
- **Pressure Ratings**
  - Inlet/Outlet: • GD62C Series: to 3,500 psig (241 BAR)
  - GD65C Series: to 7,000 psig (483 BAR)
- **Weight**
  - GD62C = 7.00 lbs
  - GD65C = 10.25 lbs

Note: Proper filtration is recommended to prevent damage to sealing surfaces.

GD67A Series
High Pressure Dome-loaded Regulator
Inlet & Outlet to 6,000 psig

Features
- Reliable
- Accurate
- Positive shutoff for zero-leak
- Remote operated
- Rapid response
- High pressure, medium flow
- Internal pressure load or external dome loading
- Panel mount option

Applications
High pressure testing
Facility gas systems
Industrial gas plants
Process gas controls
Chemical/petroleum plants

How it Works

Closed
The balanced poppet is spring-loaded against the valve seat. When full upstream pressure is applied, a slightly unbalanced force is developed which further enhances sealing.

Regulating
Dome-loading may be accomplished by the built-in load and bleed valve combination or by an externally located pressure regulator. As the downstream process demands flow, the decreasing pressure (acting on the outlet side of the diaphragm) allows the dome pressure force to push the diaphragm and lower plate down which, in turn, unseats the poppet. This action permits flow to start and the pressure under the piston to gradually increase until balance is achieved between dome pressure forces and opposing downstream pressure forces. The modulation of the poppet position continues in this manner until process flow demand ceases. The diaphragm is then moved in an upward direction, thus allowing the spring-loaded poppet to close off flow from the upstream side of the regulator.

CIRCOR Instrumentation Technologies

CIRCOR Instrumentation Technologies (CIT) is a product group of CIRCOR International (NYSE: CIR), specializing in fluid process control solutions with orifice sizes typically up to 1”. Our main product lines include ball, needle, packless, diaphragm, solenoid, and metering valves, pressure regulators, quick couplers, Gyrolok® compression tube fittings, and fully integrated sampling systems.

CIT markets primarily to the petrochemical, refining, power generation, food and beverage, semiconductor, and pharmaceutical industries, and to OEM’s. CIT separates itself from the competition by offering highly engineered components manufactured to exacting standards and a variety of custom options.
